Sole Supports

True Custom, **Biomechanical Foot Orthotics**

GOOD POSTURE AND JOINT HEALTH begin where the foot meets the ground...

Efren Buff De La Rosa, DPM, F.A.C.F.A.S.

PODIATRIC SURGEON

What is an orthotic?

An orthotic is a supportive device which is placed inside footwear, to change the mechanical function of the foot. It works dynamically during weight-bearing activities like walking, running and standing. Ideally, it should provide full, custom and corrected arch contact so that the foot works in a biomechanically correct way. To date, only Sole Supports manufactures full arch contact orthotics, calibrated to flex for your weight and foot type. The reason for this is simple: they are more difficult to make because they must actually change the way your foot works and need to be comfortable at same time. Other orthotics are either 1. Arches Collapse just cushions or have a one-size-fits-all, poor arch

These orthotics may feel fine, but by failing to actually change foot posture and function, they will not prevent or alleviate the usual painful deformities or syndromes.

What are faulty foot mechanics?

support that is not customized to your foot.

The foot is designed to un-lock or pronate when it hits the ground for shock absorption and to conform to variable terrain. It then must re-stiffen (lock), or supinate, for efficient leverage as it propels the body forward onto the next step. When either of these phases are excessive or out-off-sync the foot has faulty mechanical function. The majority of us over-pronate, that is, our arches flatten too much (flat feet) and do not re-stiffen enough for efficient propulsion.

About four percent of us are over-supinators with high, rigid arch structure, creating poor shock absorption and weight-bearing pressure concentrated in a few spots.

What kinds of problems result from faulty foot mechanics?

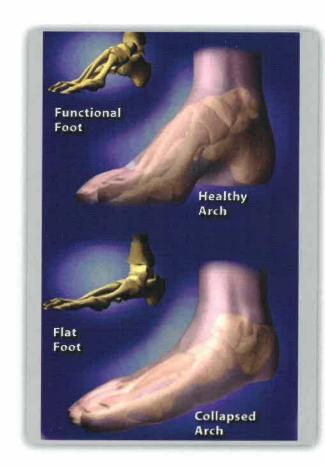

Pain and deformities can arise in the 3. Pelvis Tilts feet such as bunions, plantar fasciitis, corns and hammertoes. Because foot function affects the entire chain of bones leading to the spine, pain and dysfunction in the knee, hip and low back often result as well. In all there are over thirty common diagnosis related to poor foot function.

Can problems be prevented or corrected with the use of Sole Supports?

Yes. If the problem is caught early enough, pain and deformity can often be prevented. Regular use of these unique orthotics can often reverse

deformity development or at least prevent surgery. How? Because when you restore normal function you give your body what it needs to heal itself. A typical orthotic only masks your symptoms temporarily, until further deformity makes things worse. When you restore healthy foot function other treatments or therapies are more effective and last longer.

How long will it take for my symptoms to go away?

That will depend on how advanced your condition is, flexibility of the deformity if one is present, age and general health, all affect symptom relief. For most people, significant relief is experienced within weeks of regular use; at most, it may take a few months.
